

# Announcements

Announcements (Extra credit for any of these)

Thursday Extra: Thursdays@4:00 in Science 3821

Next week: Off-campus Study in CS

Class slides posted weekly (link on syllabus)

eSpeak update

New lab partners for this week (stay tuned)

Today's outline

- Working with partners
- Procedures
- Using procedures to structure solutions
- Incremental software development

# Working with Partners

Driver, Navigator

Listening, anticipating

Change person at keyboard at least every class!

Constructive tone!!!!

Write on a card (and give to me)

- what worked well for you in CSC 151
- what could have gone better (and what do you suggest as an approach to help resolve the troubles)

I'll put together your responses (anonymously) for next class

Consider the following program: What is printed?

```
#include <stdio.h>

void procA ()
{
    printf ("A\n");
}

void procB ()
{
    printf ("B\n");
    printf ("    B1\n");
    printf ("    B2\n");
}

void procC ()
{
    printf ("C\n");
}

int main ()
{
    procA ();
    procB ();
    procA ();
    return 0;
}
```

- A. A  
B  
B1  
B2  
C
- B. A  
B  
B1  
B2  
A
- C. A B B1 B2 C
- D. A B B1 B2 A
- E. none of the above

### 3 Widely observed problem-solving tips:

1. Hours of coding can save minutes of planning
2. Write comments first (to clarify your thinking)
3. You don't have to develop a large, complex program all at once!
  - Start with a small piece that has steps identified (perhaps procedures as stubs)
  - Add elements, a few small pieces at a time
